What is it? The primary function of AutoCAD is to design, document, and visualize models. You can perform architectural, engineering, and landscape design tasks using AutoCAD, but it is also used to design and document mechanical and electrical systems, custom products, and more. AutoCAD is used to model the following structures and systems: Architectural, Engineering, and Landscape HVAC, plumbing, electrical, water/wastewater, and waste-management systems Buildings, including residential, commercial, institutional, and governmental buildings Vehicles Furniture, fixtures, equipment, and machines Granite, marble, and other stone and masonry products Construction and Mining Power plants, bridges, and other infrastructure Machinery, including custom, standard, and non-standard machines Products Railroad and Public Transportation Cargo and Freight Transportation Industrial Agriculture Consumer Products You can also design and build 3D models. You can model in AutoCAD, and use AutoCAD to modify, repurpose, and remodel those models. With the use of its powerful features, AutoCAD is powerful enough to create 3D models that can then be virtually explored and evaluated with a combination of tools. How do I use AutoCAD? Use AutoCAD to create two-dimensional drawings. You can use AutoCAD as a standalone app, or you can access AutoCAD through the cloud. If you want to access drawings you have created and modified in the cloud, you must use the cloud service. If you are a licensed AutoCAD subscriber, you can use AutoCAD to design 2D and 3D models. You can then use the free-form drawing tools in AutoCAD to modify and explore those models as you design and build them. You can also use AutoCAD to explore the models you create with other CAD programs, or modify the models you design in other CAD programs. AutoCAD is available as a desktop app. You can use the desktop app to open files, create a new drawing, open a drawing, open or save a drawing, and close drawings. You can also access the cloud service through a web browser, your desktop, or your mobile device. The following sections explain how to use AutoCAD and the

Architectural HMI (Human Machine Interface) is a small add-on to the Microsoft Windows operating system, developed and marketed by Autodesk. It provides a 3D representation of an architectural drawing. It is included as a component of AutoCAD Activation Code LT and AutoCAD Architect. Command Window, a native feature of AutoCAD and AutoCAD LT, is a separate application with a similar user interface. Extended Application, Autodesk Exchange Apps, is the name given to various Autodesk-developed applications that can be accessed through Autodesk Exchange, a website for the exchange of features and files of AutoCAD software. Open architecture Unlike many proprietary CAD software systems, Autodesk's CAD products use a 'Platform as a Service' (PaaS) model of development. Products are typically composed of a collection of objects which can be either a small standalone application or a component within a larger framework. Each object is written in the same programming language as the rest of the system, and, except in rare cases, the object is not proprietary. This allows customers to modify and extend the product, and reuse code for application development. The design of the product is based on the idea of a free-form drawing, where the only constraints are the graphics defined in the drawing. These constraints are expressed as rules, which define allowable drawing elements and aspects. Autodesk Application Framework (AAF) is the term for the system which allows user-defined objects to be dynamically composed and integrated into a drawing, as well as provide a consistent user interface to all objects. AAF is the underlying technology used to build the core design engine for AutoCAD, AutoCAD LT and other CAD applications. It consists of several components: DataLink - The DataLink component allows various interfaces to read and write data to a drawing in CAD formats, such as DWF, DXF, TRS, or CDR. It also allows the modification of existing files in CAD formats. Bridge - The Bridge component enables the creation of new types of objects for AutoCAD, such as groups, legends, and dynamic views. Workflow - Workflow is an object used to provide a user interface to the application. All of the objects are written in C++. Objects can be represented as COM objects. As a result, the product does not depend on any specific programming language. The ability to use a freely available programming language is intended to allow users to expand
